10 pieces of advice I wish my PhD advisor had given me

Jim Kurose
Department of Computer Science
University of Massachusetts
Amherst, MA USA
http://www.cs.umass.edu/~kurose
With great affection and apologies to my advisors

Mischa Schwartz, EE Department, Columbia University

Yechiam Yemini
CS Department
Columbia University

and a disclaimer.....
I wish I'd taken more math courses!

Take math courses!
- every math course I’ve taken has been valuable
- won’t have time later
- research fields draw increasingly on math as they mature
- theory is timeless!

study broadly
I wish I’d taken more math courses!

**Important courses outside CS**
- signal processing
- control theory
- information theory
- nonlinear optimization
- stochastic processes
- game theory
- domains: systems biology, economics,…
I wish I’d taken more math courses!

- you will never again have so much “relaxed” time to study, learn, think

Sorry for that piece of bad news… but it’s true
Choosing, defining a research problem

pick your problems carefully!

- what’s the fundamental issue you’re solving?
- will the problem be of interest five, ten years from now?
- focus on fundamentals in a world with an increasingly short attention span

QoS
multicast
congestion control
P2P
sensor networks
energy

A fool can ask more questions in a minute than a wise man/woman (or a Yoda) can answer in a lifetime
Choosing, defining a research problem

There are lots of smart people out there!

- avoid crowded areas unless you have a unique talent, viewpoint
  - low-hanging fruit has been picked
  - researchers working on “next big thing” are not in the crowd
- take risks (it’s research)

Wisdom of crowds?
Choosing, defining a research problem

- complexity, sophistication are themselves not of interest
- simple is sometimes harder!

[adapted from Hluchyj 2001]

maximum impact / mindshare
Choosing, defining a research problem

- avoid point solutions
  - insights that cut across solution space vs point solution
  - what broader conclusions can be drawn from your work?

You are here (but shouldn’t be)
Publishing

- publish where you will get mindshare, *impact*
  - there *is* life beyond sigcomm, infocom

- quality over quantity:
  - avoid LPUs
  - 1 widely-read/referenced paper >> K mediocre papers

- PhD thesis != magnum opus
- don’t be driven by conference deadlines
- don’t submit just to get reviews
Time: your most precious resource

- give yourself time to think
- manage your time carefully: consciously choose how you spend your time
- learn to multiplex

#4

Only “how to” book recommended by Bill Clinton

I’ve given away 50+
Learn how to write really well

- can *not* overstate the importance of good writing
  - the most important course?
- "unfair advantage" in paper, proposal review
- outstanding investment of your time
- study role models

"No tale is so good that it can't be spoiled in the telling"
Proverb

http://www-net.cs.umass.edu/kurose/writing/
Top-10 tips for writing a paper

1. Every paper tells a story
2. Write top down
3. Introduction: crucial, formulaic
4. Master basics of organized writing
5. Put yourself in place of reader
6. Write precisely (be specific, don’t embellish)
7. No one (not even your mother) is as interested in this topic as you
8. State results carefully
9. Study the art of writing
10. Good writing takes time

  by Justin Zobel

- The Elements of Style
  by William Strunk E. B. White
  (50 years old – and still a classic!)
Learn how to speak really well

- can’t overstress importance of good speaking
  - important course to teach/take?
- “unfair advantage” in mindshare
- convey exciting story/message
  - thoughtful
  - engaging
  - clear, concise
- practice, practice, practice
  - videotape, critique yourself
  - study role models
Learn the *process* of doing research

- our field is a guild
  - grad student = apprentice
  - professor = master artisan
- it’s about more than the results in your thesis
  - you’ll be generating results for a lifetime
  - knowing process is what’s most important
- why your advisor can’t (and shouldn’t) solve (or even define) the problem for you

apprenticeship
Think about what you want to do afterwards

academia:
- teaching schools
- research-1 schools
- big v small; public v private
- country?
- do you love (or at least like) to teach? students?

industry:
- many different types of industry settings
  - startup
  - “big industry”
  - research labs
- research institutes
A community of scholars

- meet people, listen, collaborate
  - good students, colleagues, friends
- approach, talk with people
- interactions with peer students
  - research discussions
  - paper presentations
  - practice talks
  - …
Identify role models

- who does something you care about really well?
  - how do they do it?
- many role models:
  - no one does everything
  - find your balance
- get a mentor
- be a mentor
The last word

Have fun – enjoy what you are doing

Best piece of advice I ever received (1984):
“Pick a place, job where you’ll have fun, enjoy living, enjoy your colleagues. Without that, no level of success will make you happy.” Jack K. Wolf
What have others suggested (1)?

learn how to deal with rejection

- it’ll happen now and then, for the rest of your professional life (hopefully not with your partner)
- learn from rejection: Why was paper/proposal rejected? What did/didn’t reviewers see/like?
What have others suggested (2)?

- know your “secret weapon”
  - what “unfair advantage” do you have over everyone else?
- learn how to change topics
  - boring to do same thing for 30 years!
  - will result in gap in measurable “productivity”
What have others suggested (3)?

- learn how to deal with stress
  - life balance, life changes, too much work
- learn how to multiplex
  - you’ll be doing it the rest of your life
- learn how to read/review/write fast, but well
  - .... and follow the 90/10 rule (it takes 50% of your time to do the job 90% well, and the 50% more time to get that last 10% done)
    - does the last 10% really matter (compared to what else you could do)?
Questions!

- What did I miss?
- What advice would you give to 1\textsuperscript{st} year student?
